SIRE SUMMARY LIST

August 1965

AYRSHIRE, GUERNSEY, HOLSTEIN, JERSEY, BROWN SWISS, MILKING SHORTHORN, RED DANE, AND RED POLL SIRES

U. S. DEPT. OF AGRICULTURE
NATIONAL AGRICULTURAL LIBRARY
SEP 2
CURRENT SERIAL RECORDS

Agricultural Research Service
U. S. Department of Agriculture

The sire evaluations, as summarized in this list, are appraisals based on production performance information available through DHIA.

The contemporary herdmate comparisons used in the USDA-DHIA Sire Summaries are especially effective in reducing environmental influences arising from herd, year, and season of calving. The primary purpose of the summaries is to use daughter-herdmate differences as well as predicted differences in evaluating bulls on the basis of estimated breeding value or transmitting ability for milk and butterfat yield. While these evaluations represent the most reliable methods available, their usefulness in ranking bulls may be seriously limited, (1) when only 1 or few herds are represented in the summary, (2) when less than 15 to 25 daughters are represented in the summary, or (3) when daughter averages only are used. Under such conditions, it is especially important to supplement the sire summary with additional information from the herd(s) in which the daughters made their records. Under any circumstance, caution should be used in predicting results based on a single mating.

The sire summaries listed, and especially those representing initial or preliminary evaluations, should be supplemented with related and other information from the herd(s) in which the daughters are located. A personal evaluation of herd feeding and management conditions is highly desirable.

When a non-AI sire evaluation is based on 5 to 9 daughter-herdmate comparisons and an AI evaluation is based on 5 to 24 comparisons, these should be considered "preliminary".

DHIA SIRE SUMMARY LIST AUGUST 1965

Ayrshire, Guernsey, Holstein, Jersey, Brown Swiss, Milking Shorthorn, Red Dane, and Red Poll Sires

This DHIA Sire Summary List contains information for 175 Ayrshire, 908 Guernsey, 2,992 Holstein, 624 Jersey, 218 Brown Swiss, 62 Milking Shorthorn, 4 Red Dane, and 1 Red Poll sires. These summaries were compiled from data received by the Animal Husbandry Research Division, ARS, up to August 14, 1965. A sire summary record is compiled for a sire when 5 or more of his AI or non-AI daughters have lactation records reported. Only daughters with herdmates are used to determine whether a bull meets the minimum requirements for evaluation. AI and non-AI daughters are always summarized separately, and each category must meet requirements independently. For example, only the non-AI progeny of a bull with 5 non-AI and 4 AI daughters will be summarized, and vice versa. This report contains summaries for the following categories: (1) new summaries (5 or more AI or non-AI progeny with herdmates available for the first time), (2) all AI sires reported as in service during 1964, (3) sires with 50 percent or more additional daughters reported since last being summarized, and (4) sires for which special requests for summaries were received.

All production records used in sire summaries consist of lactation records of 305 days or less and standardized to a mature equivalent, twice-a-day milking basis. When more than one lactation is available for a cow, all records for both the daughter and her herdmates are averaged and used to represent her performance. Incomplete records, which are reported as terminated by (1) abortion, (2) culling for low production, or (3) sold for dairy purposes, are extended to a 305-day basis and used in compiling the sire summaries. Records which are deleted and not used for summaries include those coded as complete but less than 180 days in length, those coded as incomplete but less than 15 days in length, those estimated, or those initiated by abortion. However, incomplete records may not be included for cows which calved prior to 1959.

Currently reported lactation records were accepted into master files and used in the sire summaries only if the interval from calving date to production-run date (8-14-65) exceeded 364 days. The lapse-time interval was tested and shown to be effective in reducing the high incidence of incomplete records in early sire summaries. However, the procedure applies only to records reported since the November 1964 summary. Therefore, a slight bias could remain in this sire evaluation. Rejected records were set aside and will be re-entered during the following and appropriate quarterly sire summary.

EXPLANATION OF LISTED SIRE SUMMARIES

The sire summary for the Ayrshire sire 117064, Prairie Blue Dark Boy, listed on page 8, is as follows:

```
117064   PRAIRIE BLUE DARK BOY.....................
 01-29-55     94934   478769       24 NON-AI DAUS.   -05     53  11,792  4.2  498
 AI STUD, 31-01  LISTED, 05-65      24     WITH HERDMATES     53  11,792  4.2  498      6  10,823  453
 STATES- 48, 73                                                                 DIFF.       969   45
```

To explain the sire summary above, Line 1 lists the registration number and name of the sire; Line 2 lists the birthdate of the sire, the registration number of his sire, and the registration number of his dam. (When a bull is summarized for the first time his name, birthdate, and registration numbers of his sire and dam are not available and, therefore, are not listed--to illustrate see Sire No. 117186 on page 8.) Pedigree information for each summarized sire is obtained from Herdbooks or the Breed Registry organization after the sire is summarized for the first time. This pedigree information is then included in the sire summary when the sire is re-tabulated.

"AI Stud,31-01" (Line 3) indicates that this sire is in AI service even though only natural-service progeny were available for summary. "Listed 05-65" indicates that the bull was last summarized in May 1965. "States-48, 73" (Line 4) indicate that daughters were available from the two States coded 48 and 73. A list of State codes is given on page 4.

The sire's summary includes the records of 24 non-AI daughters with a total of 53 lactation records. Herdmate data were available for all 24 of these daughters. The "-05" indicates that the 24 daughters with herdmates were in 5 herds. The number of herds will be shown up to 25, but if more than 25 herds are represented these positions will be coded with a "-25*". The 24 daughters had 53 records which averaged 11,792 pounds of milk, 4.2 percent butterfat, and 498 pounds of butterfat. The 24 daughters had an average of 6 herdmates per daughter. The average production of these herdmates was 10,823 pounds of milk and 453 pounds of butterfat. On the average the sire's daughters produced 969 pounds more milk and 45 pounds more butterfat than did their herdmates. (Negative differences from herdmates are indicated by succeeding minus signs.)

The sire summary for the Holstein sire 1258981, Rustic Mutual King Baron, listed on page 96, is as follows:

```
1258981  RUSTIC MUTUAL KING BARON.....................
 07-31-54    1040096  3129427    288 AI DAUGHTERS -25*    289  15,252  3.7  563
 AI STUD, 34-01  LISTED, 02-65      286    WITH HERDMATES    287  15,243  3.7  563     17  14,182  515     1,096  49
 STATES- 32, 34
                                  15 NON-AI  DAUGHTERS      53  17,440  3.8  665
                                  15    WITH HERDMATES      53  17,440  3.8  665      7  16,549  614
```

The above summary includes data for both AI and non-AI progeny. The AI stud in which the sire was located is indicated as "AI Stud 34-01", where the "34" indicates the State and the "01" indicates the stud within the State. On pages 3 and 4 are listed the AI Studs by State and their respective code numbers.

This sire had 288 AI daughters reported with 289 records, and 286 of these daughters had herdmate data available. The "-25*" indicates that the 286 daughters were in more than 25 herds. If they had made records in 25 or less herds, the actual number of herds represented would have been printed. For example, the bull 1259039, on page 96, had 17 AI daughters in a total of 16 herds. The explanation of the other production and herdmate data is the same as for bull 117064, except that unadjusted deviations from herdmates are not printed for bulls with 5 or more AI progeny. If desired they may be computed by subtracting the adjusted herdmate average from the average production of daughters.

In addition to the information presented for natural-service progeny, an additional measure of a sire's breeding worth is computed from the AI progeny data. This measure, listed under the heading "Predicted Difference", can be used to compare AI sires which may have varying numbers of daughters occurring in different levels of herds, with respect to producing ability of the cows and to herd management conditions. Experience has shown that the "Predicted Difference" is superior as a measure of an AI sire's breeding value, and this value is explained on the following page. Sire No. 1258981 has a "Predicted Difference" rating of 1,096 pounds of milk and 49 pounds of butterfat. (Negative differences from breed average are indicated by succeeding minus signs.)

USING THE SIRE SUMMARY DATA

The sire summary information pertains only to milk and butterfat production. When a non-AI sire evaluation is based on 5 to 9 daughter-herdmate comparisons and an AI evaluation is based on 5 to 24 comparisons, these should be considered "preliminary".

Preliminary evaluations should be considered only as an indication and not conclusive evidence of the breeding value of a sire. Aside from the number of records involved, the reliability of the preliminary evaluations on bulls first summarized prior to February 1965 may be lessened slightly due to inclusion of abnormally high proportions of records of heifers culled for low production during first lactation. Such records are received earlier than complete records initiated at corresponding dates. In general, if the data are unselected, the greater the number of comparisons of daughters versus herdmates included in an evaluation, the more reliable the evidence of the sire's breeding value. However, if a non-AI summary contains 25 unselected comparisons and an AI evaluation contains 50-60 unselected comparisons, in 25 or more herds, additional data do not greatly increase the accuracy of ranking the sires according to breeding value.

In the use of the daughter-herdmate procedure, the desirable sire is one which markedly increases the production of his daughters over that of their herdmates. This is because the sire's daughters and their herdmates had an equal opportunity to produce. The difference of the production of a sire's daughters and their herdmates is roughly the same from one level of herd production to another. Generally, a sire with a markedly negative daughter-herdmate comparison should not be expected to raise the production level of a herd.

These production data for the daughters and their herdmates should be supplemented by additional information gathered from the herd(s) in which the daughters made their records. A personal evaluation of the herd management and feeding conditions in a herd where a daughter or group of daughters made their records is highly desirable when evaluating a natural-service sire.

CALCULATION OF USDA-DHIA SIRE SUMMARY DATA

The herdmate (or contemporary) comparison is useful because it removes from the evaluation of a sire's breeding value complications arising from herd, year, and season of freshening variations in production.

Herd-year-seasons are based upon a five-month moving average. The appropriate average for the daughter of the sire is obtained by averaging all records of daughters of other sires calving in the herd in the same month as the daughters, in the previous two months, and in the succeeding two months. For example, the herdmate average for a sire's daughter calving in March would be obtained by averaging the production of all cows, except her paternal sisters, calving in that herd from January through May. All comparisons included in these summaries are on a within-breed basis.

Because the usefulness of the herdmate average is dependent in part upon the number of herdmates available, the herdmates' production is adjusted to place the herdmate data of daughters on a more comparable basis. For each individual lactation of a sire's daughter, the herdmates' average is corrected as follows:

$$\text{Adj. Herdmate Av.} = \text{Regional Breed-year-season Av.} + \frac{\text{No. Herdmates}}{\text{No. Herdmates} + 1} (\text{Herdmate Av.} - \text{Regional Breed-year-season Av.})$$

The regional breed-year-season averages are calculated from the 305-day-2X-ME DHIA lactations of cows calving from January 1, 1950 to May 1, 1964. Three regional groupings are used for Ayrshire and Brown Swiss, four for Guernsey and Jersey, 14 for Holstein, and averages for Milking Shorthorn, Red Dane, Red Poll, and mixed breed are based on all cows calving in the United States for the year-season in question. The primary cause of differences in the number of regions used for each breed was the number of available lactationa. The States composing each region are shown in Appendix table 16.

Both natural-service sires and AI sires are summarized on the basis of the daughters' average minus the average of the Adjusted Herdmates' Averages. Under AI conditions, where a sire's daughters are scattered over many herds, additional adjustments can be made to the daughter-herdmate data to slightly increase the accuracy of comparing different sires used in AI. These procedures described here, as well as those for adjusting herdmate averages, follow those developed by C. R. Henderson and co-workers at Cornell University. The daughter-herdmate difference tends to decrease slightly algebraically as the production level of herds in which the bulls are used increases. This is because those herds tend to have cows of somewhat higher producing ability. The following step adjusts for this phenomenon:

$$\text{Adj. Daughter Av.} = \text{Daughter Av.} - 0.9 \ (\text{Adj. Herdmate Av.} - \text{Breed Av.})$$

This step serves to increase (over the daughter-herdmate difference) the summary of a sire used in high-producing herds and to decrease the summary of an AI sire used in low-producing herds. The breed average production used is compiled from all DHIA cows of the breed calving in 1962 and 1963 and is listed at the bottom of this page for each breed.

In order to compare bulls which have widely varying numbers of offspring, it is necessary to adjust the above value for each sire in accordance with the number of progeny available. The Predicted Difference, which is the expected deviation of a sire's daughters from their breed average herdmates (predicted "breeding value") is calculated for the AI data of a sire as follows:

$$\text{Predicted Diff.} = \frac{\text{No. of daus.}}{\text{No. of daus.} + 20} \ (\text{Adj. Daughter Av.} - \text{Breed Av.})$$

This gives the final estimate of the breeding merit of an AI bull. With daughters scattered in many different herds, the reliability of this rating can approach maximum accuracy with a very large number of progeny. In contrast, where each bull's daughters are largely in a single herd, the accuracy of comparing sires is neither great nor materially enhanced by including more than 25 unselected progeny. The "Predicted Difference" rating is an estimate of the average difference from herdmates of many future daughters sired by the bull, where these progeny are unselected and scattered throughout all different types of herd-environmental conditions. The difference is based upon nationwide DHIA conditions as a whole. It is the most reliable method currently available for this purpose. It is applicable to individual dairymen in their choice of AI sires since a given number of bulls will rank similarly in breeding value both within and throughout a large number of herds.

DISTRIBUTION OF PREDICTED DIFFERENCE

In the Appendix are given tables indicating the variability in the Predicted Difference for milk and fat for AI sires. Table 1 for each breed presents stratifications of the Predicted Difference of milk production for the AI sires. The second table for each breed gives a similar breakdown on Predicted Difference for fat production.

These tables provide a means of rating any particular AI sire with respect to all AI sires of that breed summarized at the same time. For example, suppose that a particular Holstein AI sire had a Predicted Difference rating of +941. In the Appendix table for Holsteins (milk production) we find that of the 616 Holstein AI sires summarized, 93 percent had a Predicted Difference for milk production which was less than that of the sire we are considering (+941). This means that, if we choose a Holstein AI sire with no regard to production, we have one chance in fourteen of picking a sire genetically equal to or better than this bull.

DHIA 305-2X-ME BREED AVERAGES (1962-63)

Breed	Milk, Lb.	Fat, Lb.
Ayrshire	10,313	416
Guernsey	9,003	428
Holstein	13,059	476
Jersey	8,312	425
Brown Swiss	11,384	464
Milking Shorthorn	8,971	338
Red Dane	11,069	442
Red Poll	7,664	309

CURRENT IMPROVEMENTS IN USDA SIRE SUMMARIES

All incomplete lactations used in current sire summaries were projected to a 305-day basis by use of a new and more complete set of extension factors. These factors allow for breed, age, and milk and fat differences.

Previously, the "Predicted Difference" had been expressed in reference to the rolling 5-year U.S. breed average. To express the "Predicted Differences" in terms of current production levels, these summaries have been computed in reference to the current rolling 2-year breed average. At the same time unadjusted differences from herdmates have been eliminated to avoid the confusion resulting from two expressions of deviations.

Nationwide 5-year rolling breed-season averages have been used in the past as the base for computation of the adjusted herdmate averages. Experience has shown that such generalized measures might create inconsistencies between bulls evaluated solely in one geographical region or in a limited number of years. Currently, regional breed-year-season averages are used in the computation of adjusted herdmate averages. The States included in each region breed classification are given in Appendix table 16.

Lactations that were not identified with a standard 8-digit DHIA herd code were not used in these sire summaries. All such lactations were initiated prior to 1957. This change may reduce the total number of daughters averaged for some bulls, but will not reduce the number of daughters with herdmates.

The value, $\frac{\text{No. of daus.}}{\text{No. of daus.} + 12}$, has been used by the USDA as an index of accuracy for sire evaluations based on AI progeny, since it has been well known that the relative accuracy of sire evaluations increases with a greater number of daughters. However, recent research has shown that the value, $\frac{\text{No. of daus.}}{\text{No. of daus.} + 20}$, more adequately reflects the true accuracy of AI sire evaluations as measured by the group regression of a future daughter on an early group of daughters. The latter regression, $\frac{\text{No. of daus.}}{\text{No. of daus.} + 20}$, has been used in the current summaries, and this change has the effect of placing slightly less reliability on sire evaluations based on small numbers of progeny.

ARTIFICIAL-INSEMINATION ORGANIZATIONS IN THE UNITED STATES

OHIA SIRE SUMMARY RECORDS, OF SIRES IN AI SERVICE, INDICATE BY CODE NUMBER THE LAST AI ORGANIZATION OWNING THE SIRE. FOLLOWING IS A COMPLETE LIST OF AI ORGANIZATIONS THAT HAVE OPERATED IN THE UNITED STATES--ACCORDING TO REPORTS RECEIVED IN THE ANIMAL HUSBANDRY RESEARCH DIVISION. SOME NO LONGER EXIST, BUT SIRES IN SUCH ORGANIZATIONS MAY BE SUMMARIZED, IN WHICH CASE REFERENCE WILL BE MADE TO THE ORGANIZATION IN THE SIRE SUMMARY DATA.
